Two known full-task probes: 0 / 2 pass the original full-episode gates
Same CPU world, seed 56002; actual anchor + held velocity feedforward
A UR5e: residual payload is released later
In source
In receiver
Outside / flight
64 retained at feedback end
62 of these become outside after release
Particles
Native time (s)
B Flexiv: return reaches a joint bound
Actual q4
IK q4
Original buffered lower limit
Joint angle (rad)
Native time (s)
C Original local-IK acceptance fails
Optimized IK residual
Original 0.02 rad gate
Rejected at 16.040 s
Orientation residual (rad)
Native time (s)
UR5e: 175 / 240 received, 63 outside. Flexiv: 232 / 240 received; return stops at 16.040 s.
Sampled native traces and recorded IK only; no new physics. Chronology does not prove a unique cause or global unreachability.
