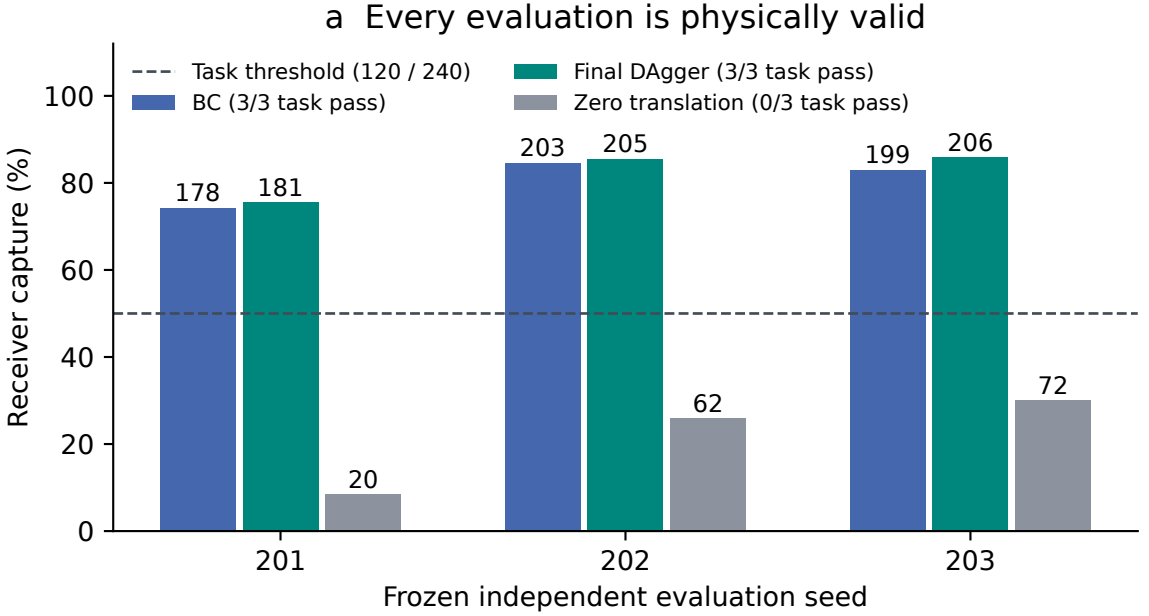
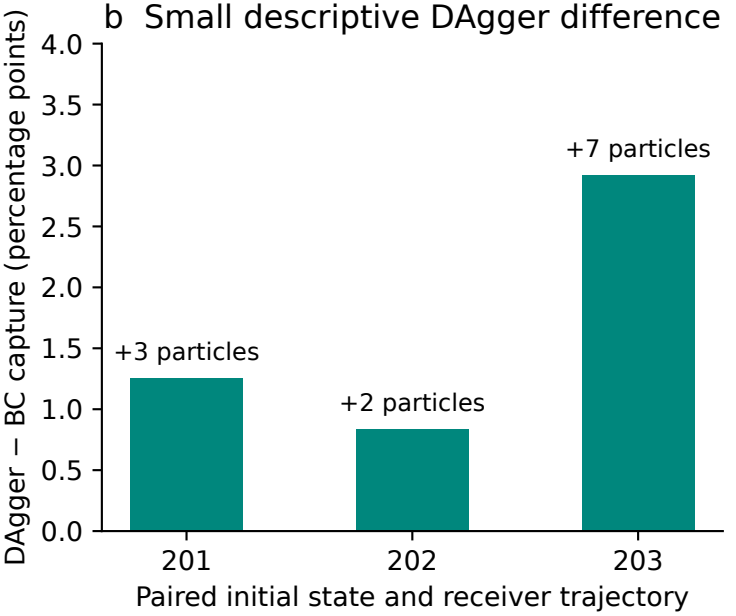
Verified moving-receiver pilot: three paired holdout scenarios





Native MuJoCo + 240-particle DFSPH; 1.8 s after a prescribed post-grasp reset; no expert calls at evaluation.

Only EE translation is learned; all arms share the scripted tilt. BC: 144 labels; final DAgger: 432 labels.

n = 3 scenarios: no broad generalization or isolated DAgger mechanism claim. Zero control also removes initial alignment correction.
